

# A Reminder for Hot Weather Concrete

*Helpful hints:*

- *Modify concrete mix designs (retarders and/or water reducers talk to the RM Producer)*
- *Increase curing practices*
- *Check timing for concrete placement (early morning or late evening)*
- *Have adequate manpower to place the concrete*

*Our CPG website has a Hot Weather Concrete Flyer for easy download or printing. Go to [www.concretepromotion.com](http://www.concretepromotion.com) click on “concrete corner” then scroll down to “Hot Weather Concrete”.*

*Please feel free to pass this on to contractors, municipalities, engineers, etc.*

*CPG sent a link to our database of engineers, architects, and contractors recently. Several email replies have come back, with the following comments: “good timing on the hot weather concrete reminder, it came in handy”, and “...we can always use a reminder, thanks”. KC had a mild winter and a mild spring. The metro area is just now getting into the “heat” of summer. Practices have to change with the ambient temperatures.*
